

SR 520: Geotechnical Drilling in Progress (March 2011)

WSDOT has begun collecting geotechnical samples to analyze the composition and properties of soil along the SR 520 corridor.

Samples collected on land and over water will provide information to the engineers designing foundations, lid structures, retaining walls and storm-water facilities for the proposed road. Over-water collections are expected to be complete by late April 2011. On-land drilling will occur through fall 2011.

For questions, WSDOT has established a fieldwork hotline at 206/708-4657. NCHNA has requested information on the specific locations where drilling will take place. Stay tuned.
